

# MEASUREMENT OF THE CHARGE AND LIGHT YIELD OF LOW ENERGY ELECTRONIC RECOILS IN LIQUID XENON AT DIFFERENT ELECTRIC FIELDS

---

Matthew D. Anthony

April 12, 2015

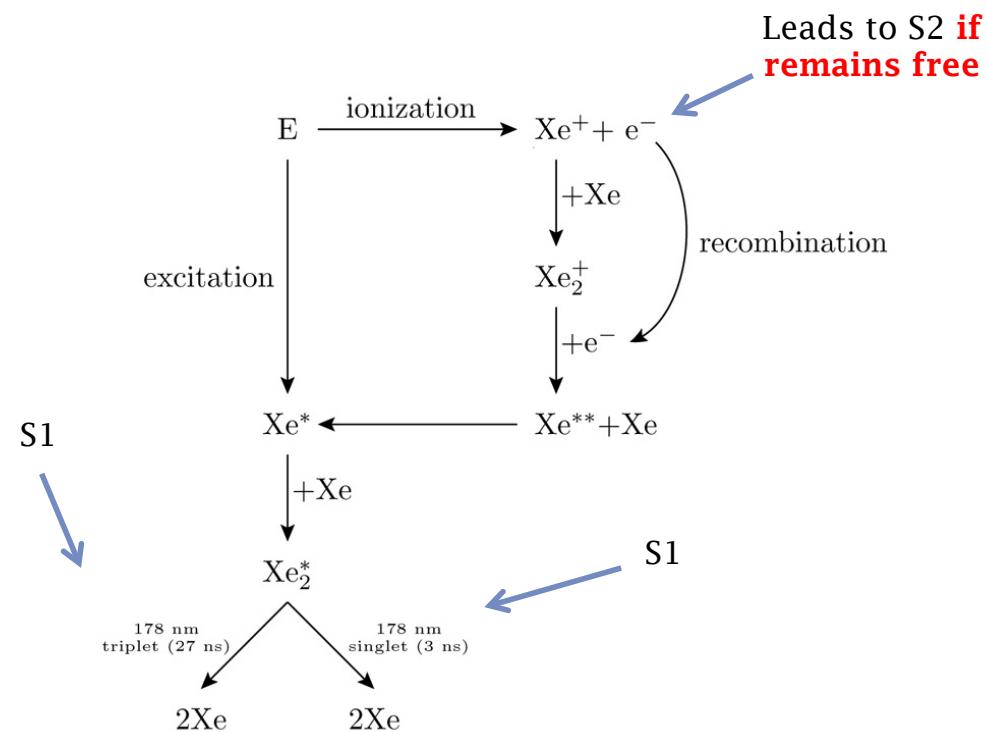

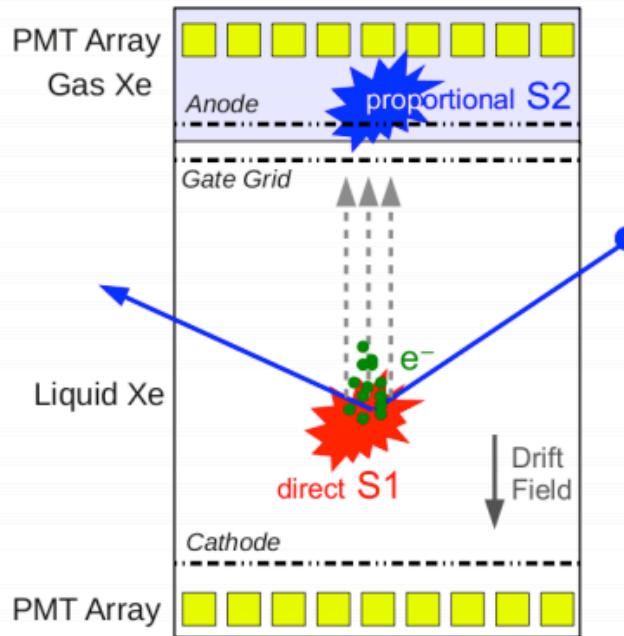

# Motivation

LXe experiments lead direct dark matter scattering search

- Xenon100, LUX, Xenon1T

Dual-phase detectors → simultaneously detect light and charge

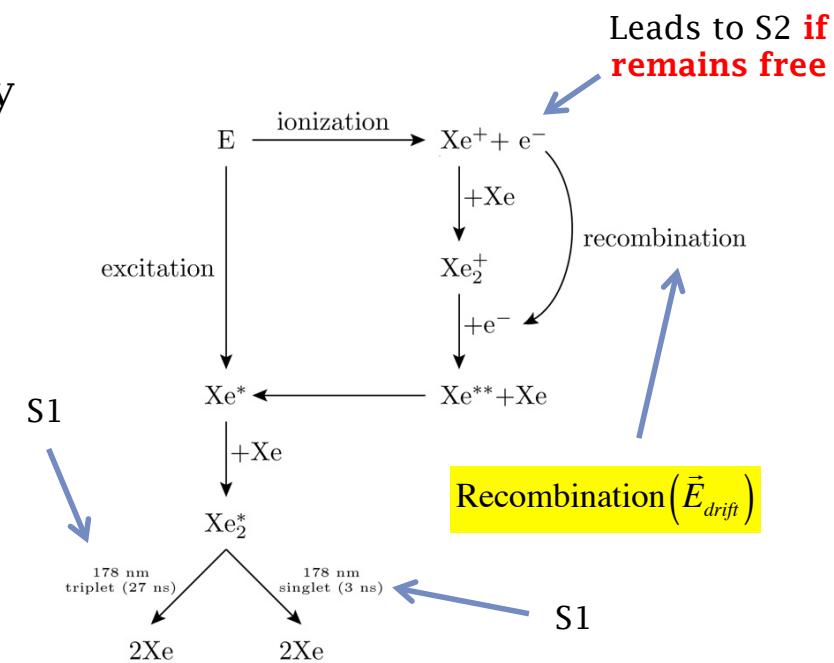

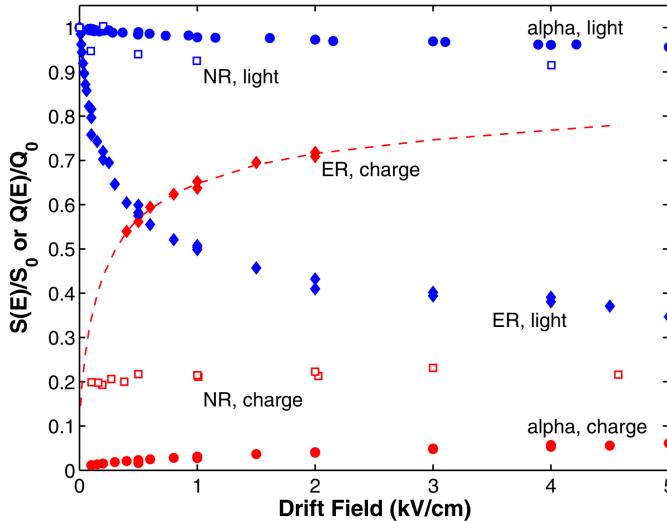

- Prompt light emission from interaction in LXe (**S1**)
- Complementary signal from acceleration of electrons through GXe (**S2**)

# Motivation

**Goal:** improve understanding of low energy interactions in LXe

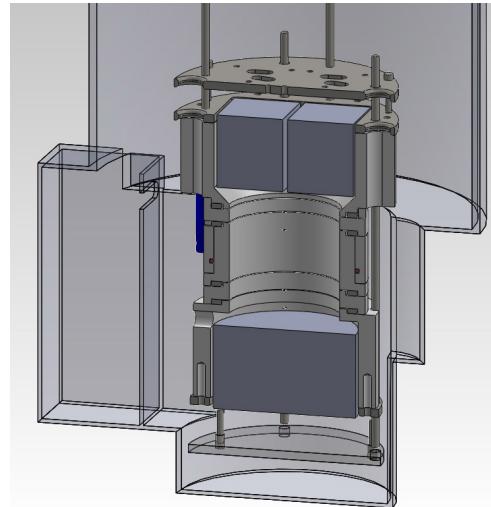

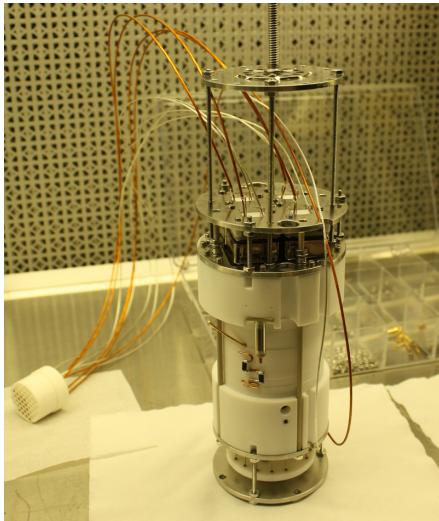

- Given an electronic or nuclear recoil at a certain energy in a drift field, how much light and charge do you expect to be produced?
- Light and charge yield **non-linear** in energy or drift field
  - Light Yield = Photoelectrons / Energy
  - Charge Yield = Free Electrons / Energy

# neriX Detector

Dual-phase LXe Time Projection Chamber for measuring  
**nuclear and electronic recoils in Xenon**

- Small size and minimal materials surrounding fiducial volume make this detector well-suited for measurements of the light and charge yield
- Unlike most previous measurements, can measure the light yield as a function of drift field applied
- Pursue light and charge yields as low as 1 keV

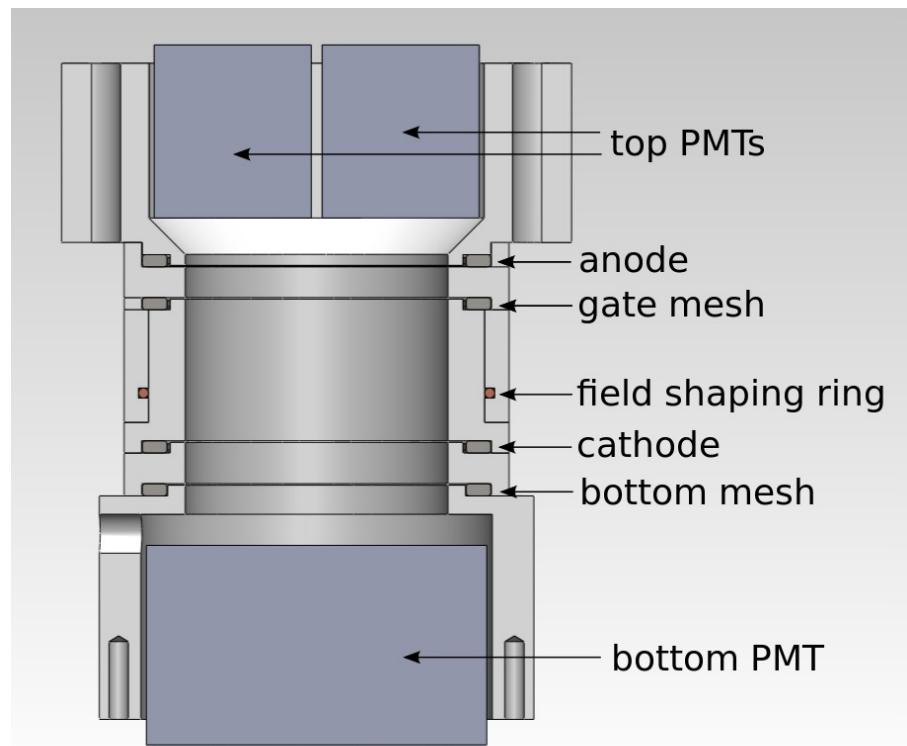

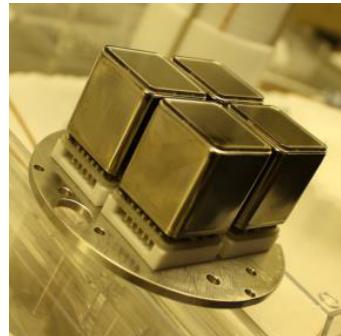

# neriX Detector

Very similar design to its much larger cousins

- Dual-phase (S1 and S2)
- 3D Position Reconstruction
- Stable cryogenics system

## PMTs

- 4 1" square 4 channel PMTs on top (total of 16 channels)
- 1 2" diameter HQE PMT on bottom

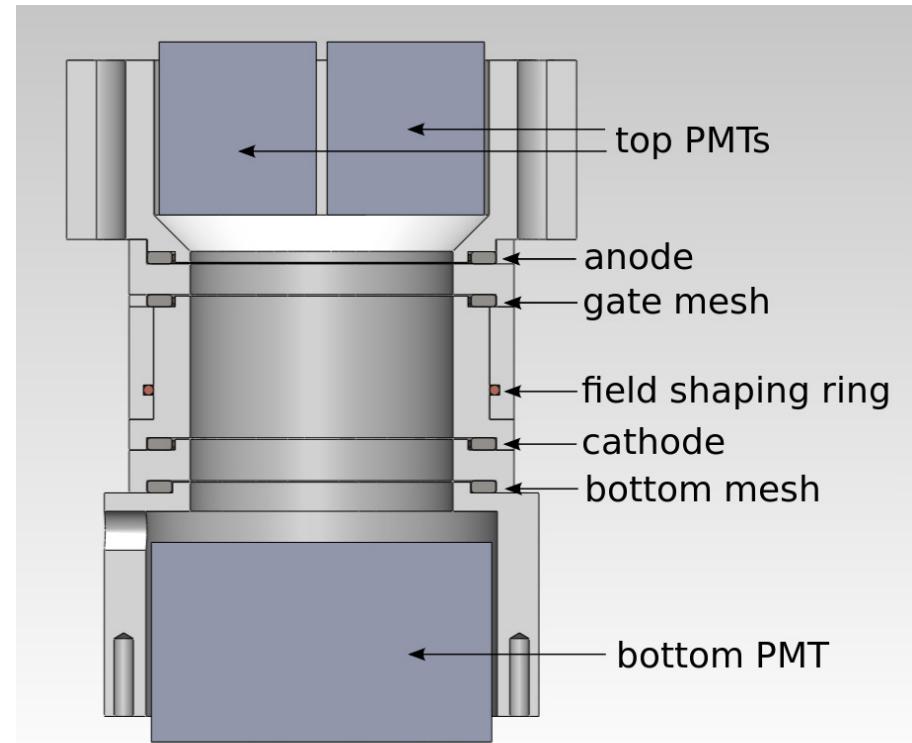

Component	Voltage [kV]
Anode Grid	4.5
Gate Grid	0
Shaping Rings	0
Cathode Grid	-0.345, -1.054, -2.356, -5.500
Bottom Mesh	0

# Drift Fields

Measured the light and charge yield at four different drift fields

- All components but cathode kept constant between setups
- Simulations of the field performed in Comsol

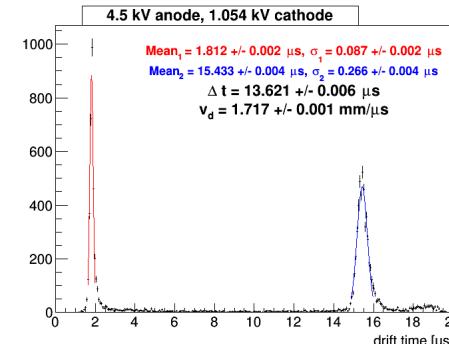

Cathode Voltage [kV]	Drift Field [V/cm]
-0.345	210
-1.054	490
-2.356	1000
-5.500	2250

Component	Voltage [kV]
Anode Grid	4.5
Gate Grid	0
Shaping Rings	0
Cathode Grid	-0.345, -1.054, -2.356, -5.500
Bottom Grid	0

# Single Photoelectron and Electron Detection

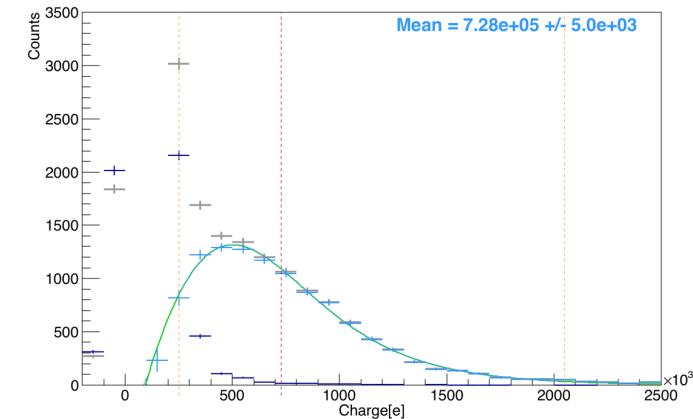

- Single Photoelectron Gain
  - Use LED at low light level to measure SPE gain
  - Relatively low gain ( $\sim 4\text{-}7 \times 10^5 \text{ e}^-$ ) to avoid saturation
  - Use background subtraction and coincidence cut to clean distribution
- Single Electron Gain
  - Use photoionization of cathode by S2 to find small numbers of electrons

Photoionization of Gate and Cathode

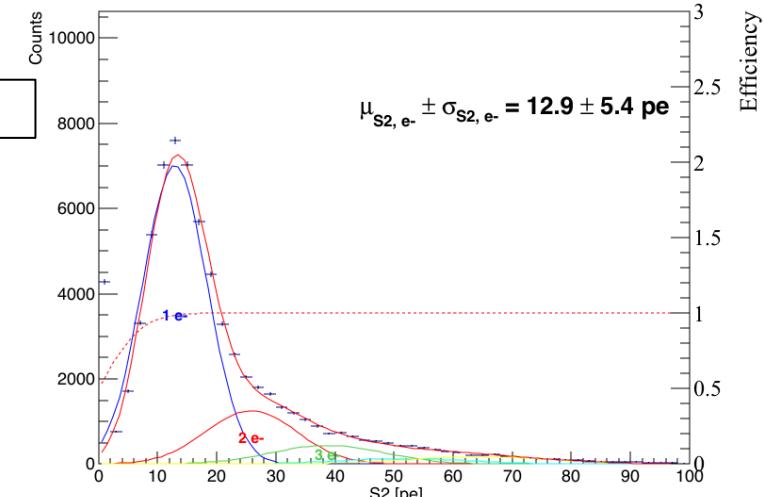

More details on single electron gain: J. Phys. G: Nucl. Part. Phys. 41 (2014) 035201

SPE Gain Calibration

Single Electron Gain

# Position Reconstruction

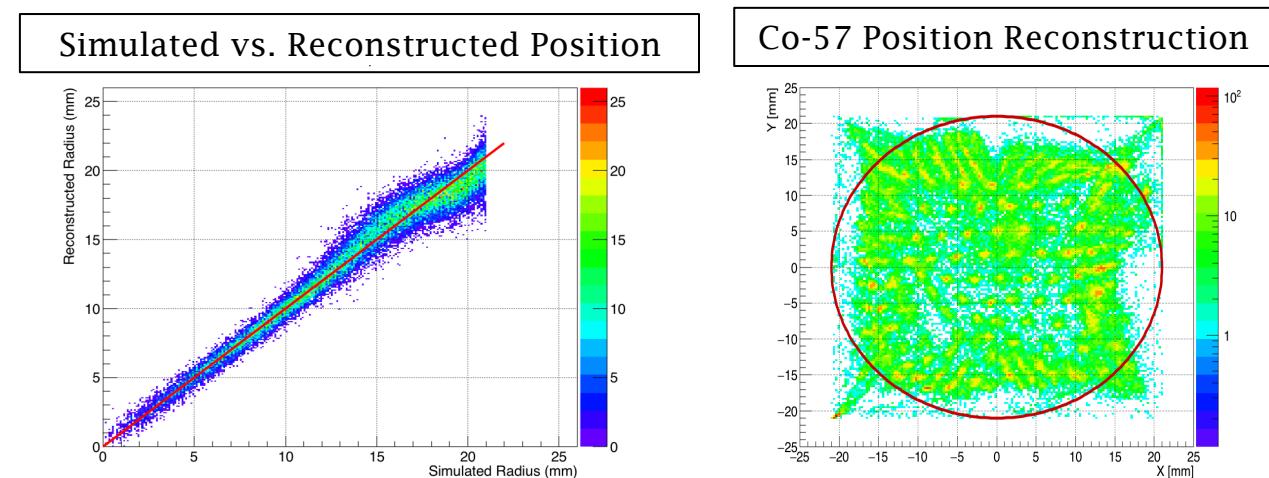

Similar to larger LXe detectors, neriX is able to reconstruct the 3D position of an event

- More difficult given small size of the detector
- Used Geant4 construction of the detector to simulate S2 patterns at given positions
- Train neural network on the simulation using FANN open source library
- Average error of simulated data inside radius of 18 mm  $\approx 0.5$  mm

$$\{S2_1, \dots, S2_{16}\} \Rightarrow$$

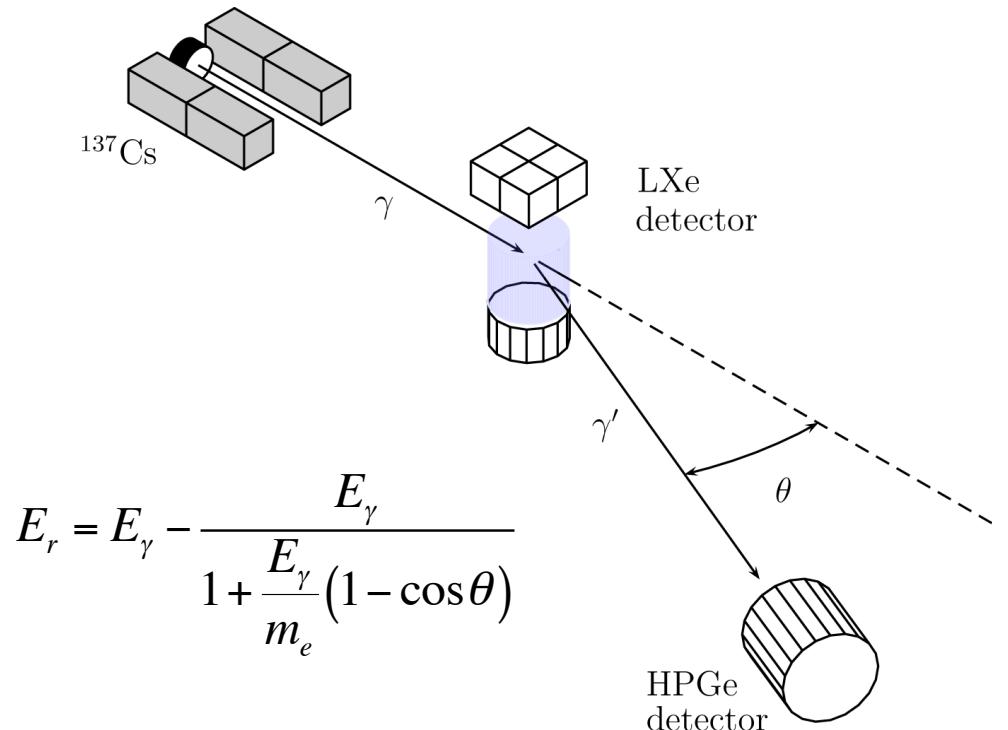

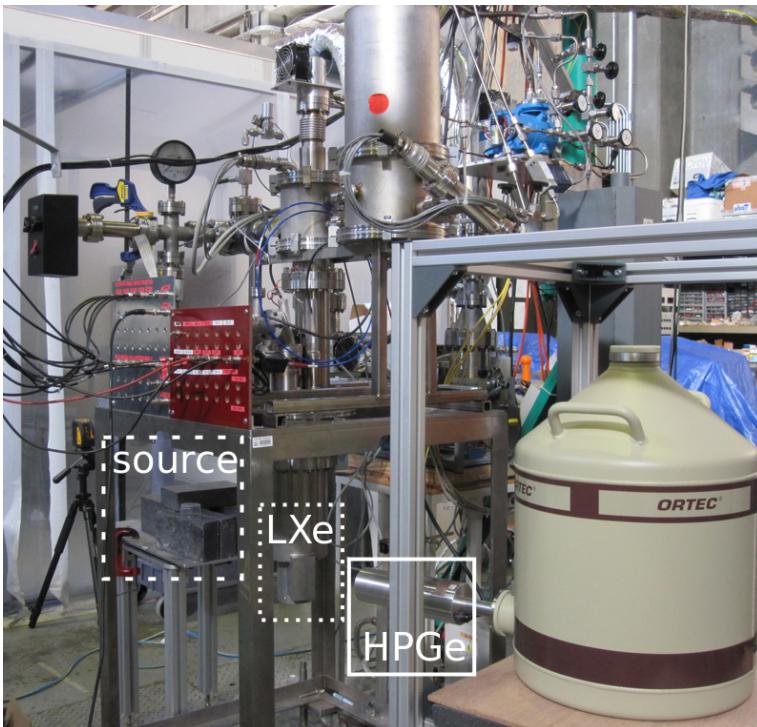

$$\Rightarrow \{X, Y\}$$

# Compton Coincidence Technique

Energy deposited in LXe determined using Compton Coincidence Technique

- Photons Compton scatter in LXe then deposit remaining energy in HPGe detector

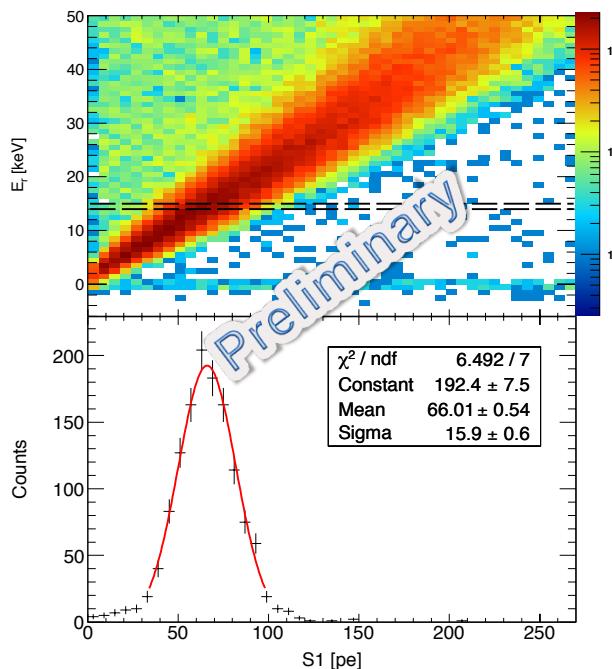

# Coincidence Spectrum

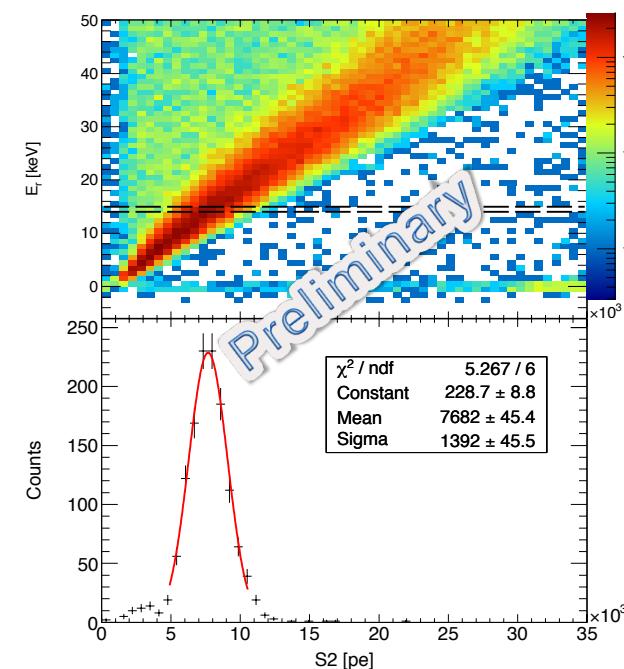

Below are two sample coincidence spectra that are used to determine the light and charge yield at a given energy

All data are **preliminary**

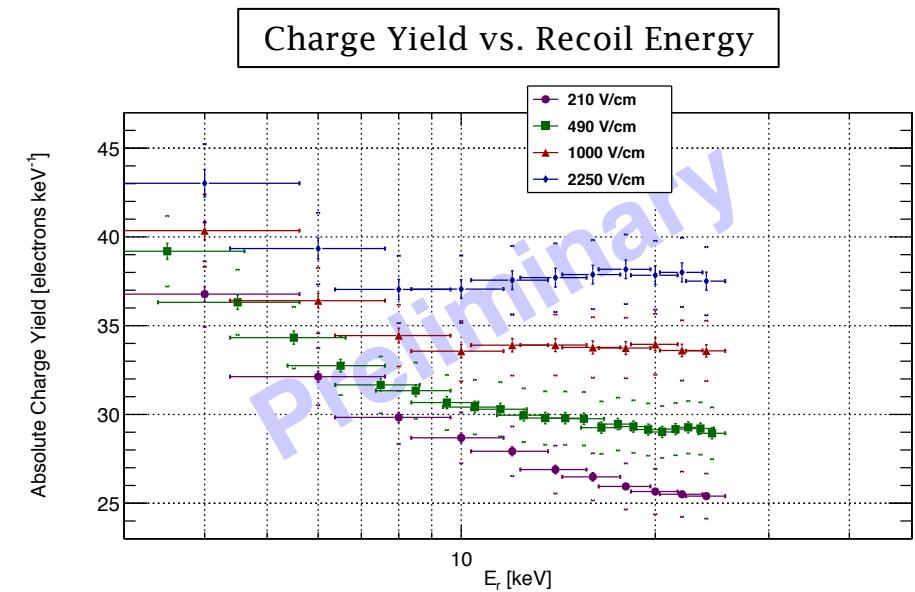

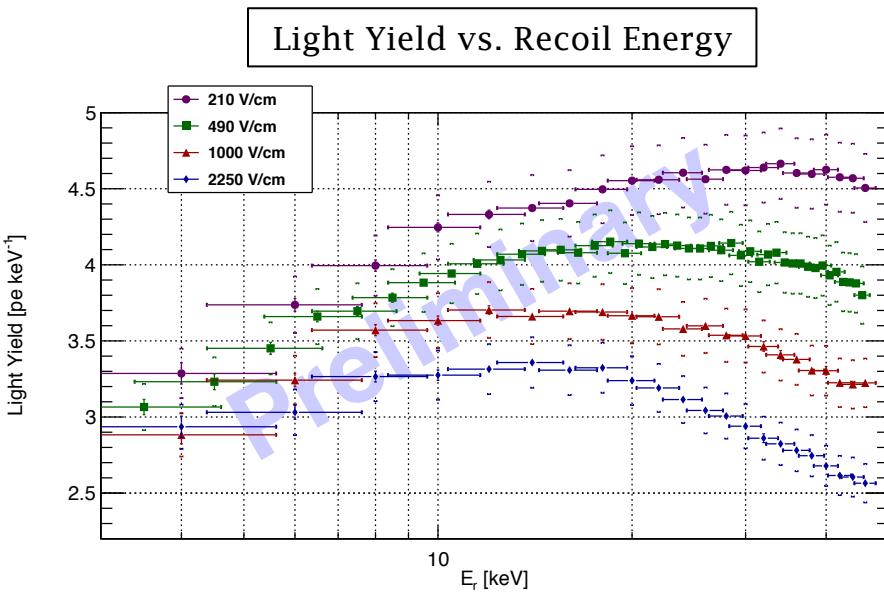

Prompt Scintillation Light (S1)  
vs. Energy Deposited in LXe

Proportional Scintillation Light (S2) vs. Energy Deposited in LXe

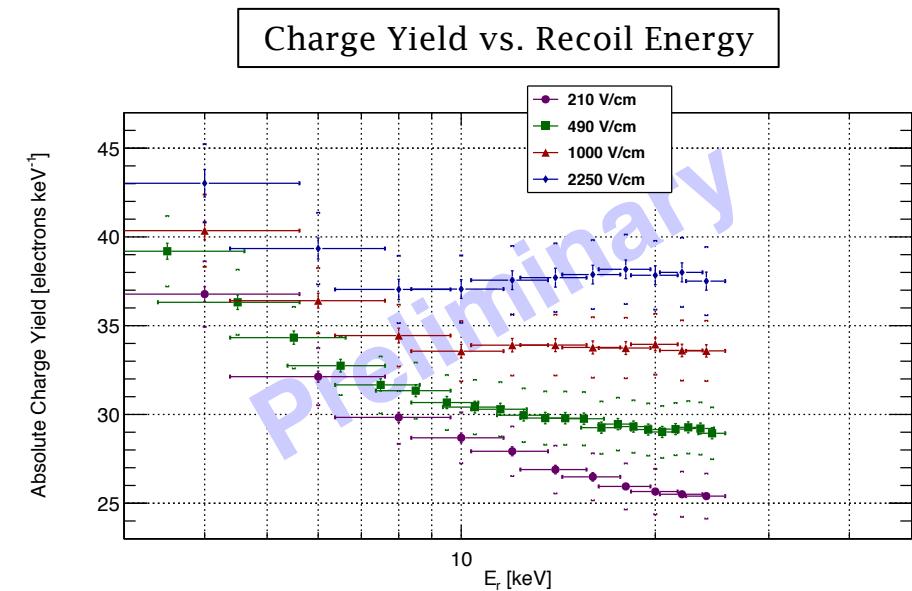

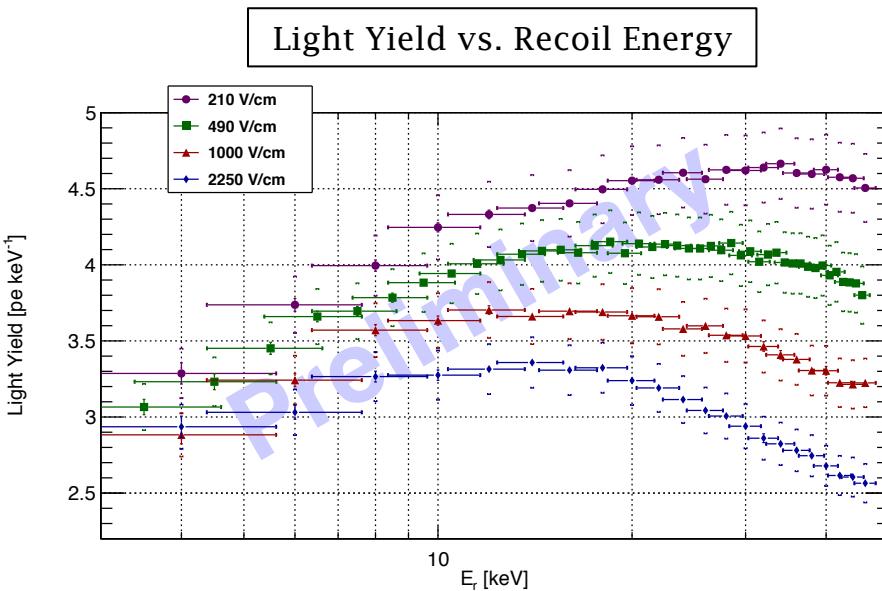

# Electronic Recoils: Light and Charge Yields

- By projecting energy slices in the previous plots into S1 and S2, we can fit the remaining spectrum for the yield
- Above are preliminary results for the light and charge yield at different drift fields

# Electronic Recoils: Light and Charge Yields

- S1 and S2 **anti-correlated** with respect to field
- Below 10 keV, light yield **increases** with energy and charge yield **decreases** with energy for all fields
- Light and charge yield measured down to 1 keV - stay tuned!

# Nuclear Recoils: Light and Charge Yields

- In coming months, will perform very similar measurement with neutron source
- Similar concept but with additional complications
  - No energy resolution in liquid scintillators - completely dependent on scattering angle for determination of energy deposited in LXe
  - Must account for neutron time of flight in coincidence trigger
